

Expansion Tank Assembly / Engine Dynamometer

The Expansion Tank Assembly is intended to be used with a Closed Loop Cooling Center (CLCC). The tank will improve the performance of the cooling system by providing room for the coolant to expand without it flowing past a relief valve back to the storage tank. This will result in more consistent coolant pressure during engine operation.

In addition, the tank should be placed high in the test cell so that it can collect any gas bubbles that form in the coolant. Removing these bubbles will improve the performance of the cooling system.

Everything you need to succeed
